# 6 Evaluation of alignment scores

## 6.1 Statistical analysis

Statistical tests are performed to give an explanation to observed alignment scores.

### Hypothesis testing

- Alternative hypothesis
- Null hypothesis

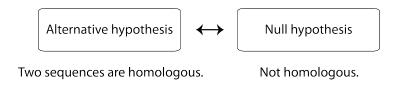

Figure 6.1: The null hypothesis and the alternative hypothesis

#### P-value

"The p-value is defined as the probability of obtaining a result equal to or more extreme than what was actually observed, assuming that the null hypothesis is true."

- the p-value page on Wikipedia (https://en.wikipedia.org/wiki/P-value)

#### Significance level $(\alpha)$

The significance level should be chosen to indicate strong/weak evidence against the null hypothesis.

Significance levels 0.05 and 0.01 are often used in life sciences.

- Statistically significant:  $\alpha = 0.05$
- Statistically highly significant:  $\alpha = 0.01$

#### Common misunderstandings of p-value

"The p-value is not the probability that the null hypothesis is true or the probability that the alternative hypothesis is false."

- the p-value page on Wikipedia (https://en.wikipedia.org/wiki/P-value)

## Underlying (background) score distributions

Table 6.1: Alignment methods and distributions

| Method                     | Underlying distribution |
|----------------------------|-------------------------|
| Global alignment           | Unknown                 |
| Local alignment (ungapped) | Gumbel                  |

# 6.2 Evaluation of global alignment

The underlying distribution of global alignment scores is unknown.

## Random generation of sequences

One needs to consider using the appropriate length and compositions of amino acids or nucleotides needs when creating randomised sequences.

## Example

Input sequences

q: ACGT d: AGTACC

Frequencies:  $f_A = 0.2, f_C = 0.4, f_G = 0.1, f_T = 0.3$ 

Length: 6

d1: CCAGTC
d2: TCACCG
d3: CTTGAA

. . .

### Frequency distributions

- Universal (e.g. the whole protein database)
- Global (e.g. protein super families)
- Local (e.g. query and database sequences)

#### Additional constrains

Constrains on sequences generation are often considered.

- Di-amino acid frequencies
- Sub-region specific frequencies

#### Non-parametric test and p-value

The simplest non-parametric test is calculating the rank of the score for the original alignment as the p-value.

$$p = (b+1)/(n+1)$$

where b is the number of randomly generated scores above the score of the original alignment, and n is the sample size.

**N.B.** n should be sufficiently large (e.g. >1000) to estimate an accurate p-value.

## Example

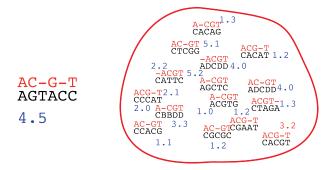

Figure 6.2: Randomly generated sequences and alignment scores

| 1 | 2   | 3   | 4   | 5   | 6   | 7   | 8   | 9   | 10  | 11  | 12 | 13  | 14  | 15  | 16  | 17  | 18  | 19  | 20  |
|---|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|-----|-----|-----|-----|-----|-----|-----|-----|
| 1 | 1.1 | 1.3 | 1.4 | 1.7 | 2.1 | 2.2 | 2.2 | 2.3 | 2.5 | 2.8 | 3  | 3.2 | 3.3 | 3.4 | 3.6 | 4.2 | 4.4 | 4.7 | 5.2 |
|   |     |     |     |     |     |     |     |     | 4.  | .5  |    |     |     |     |     |     |     |     |     |

p-value: (2+1)/(20+1) = 0.1429

- Significance level  $\alpha = 0.2$ : reject the null hypothesis
- Significance level  $\alpha = 0.05$ : the null hypothesis is not rejected

#### Exercise 6.1

1. Calculate the frequencies of nucleotides from the four sequences below.

d1: CCAGCd2: TCACGd3: CTTAAd4: AACAA

Frequencies:  $\{f_A = , f_C = , f_G = , f_T = \}$ 

2. Calculate the p-value of the alignment below.

q: AACG d: A-CG Score: 40

Assume that the scores are pre-calculated for the alignments of the query sequence and nine randomly generated sequences as follows. Use them for the p-value calculation.

| No.   | 1 | 2  | 3  | 4  | 5  | 6  | 7  | 8  | 9  |
|-------|---|----|----|----|----|----|----|----|----|
| Score | 4 | 14 | 33 | 45 | 74 | 76 | 82 | 83 | 94 |

## 6.3 Evaluation of local alignment

The underlying distribution of local alignment scores is an extreme value distribution.

#### Gumbel distribution

The Gumbel distribution is a member of the extreme value distribution family.

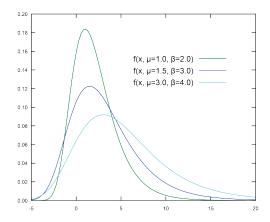

Figure 6.3: Gumbel distribution (source: Herr blaschke, Wikimedia Commons)

The cumulative distribution function (CDF) of the Gumbel distribution:  $F_Y(y) = exp[-e^{-\lambda(y-\mu)}]$ 

#### Parameters

- $\mu$ : the modal value of the distribution, characteristic value
- $\lambda$ : a measure of the variance, decay constant

#### Extreme value distribution

An extreme value distribution is a limiting distribution for the minimum or the maximum of a sufficiently large sample. Ungapped alignments with large sequence lengths are known to have this type of distribution.

#### Example (m and n are not large in this example)

|   |   | A   | $\mathbf{C}$ | G   | $\mathbf{C}$ | A   | $\mathbf{C}$ | G   |
|---|---|-----|--------------|-----|--------------|-----|--------------|-----|
|   |   |     |              |     | 0            |     |              |     |
| С | 0 | 0   | 0.5          | 0   | 0.5          | 0   | 0.5          | 0   |
| G | 0 | 0   | 0            | 1   | 0.5          | 0.2 | 0            | 1   |
| A | 0 | 0.5 | 0            | 0.5 | 0.7          | 0.2 | 0            | 0.5 |

| CG | CG | GC  | AC     |      |
|----|----|-----|--------|------|
| CG | CG | GA  | <br>CG | <br> |
| 1  | 1  | 0.2 | -0.6   |      |

#### Parameter estimation

The p-value of the Gumbel distribution can be calculated as:

$$P[Y > y] = 1 - F_Y(y) = 1 - exp[-e^{-\lambda(y-\mu)}]$$

The parameters  $\mu$  and  $\lambda$  can be estimated from the arithmetic mean  $m_Y$  and the variance  $\sigma_Y^2$  of the observed sample.

$$\lambda \approx 1.282/\sigma_Y$$

$$\mu \approx m_Y - 0.577/\lambda$$

## Example of parameter estimation

Below is the optimal local alignment with the score between q:ACAGACTACTA and d:TCAGACTGGGAACCE.

CAGACT
CAGACT
Score: 6

The mean and the variance of the alignment scores are estimated as follows from randomly generated sequences.

 $m_Y$ : 1.7221  $\sigma_Y$ : 1.6025

Then,  $\lambda$  and  $\mu$  are estimated from  $m_Y$  and  $\sigma_Y$ .

$$\lambda \approx 1.282/1.6025 = 0.8$$

$$\mu \approx 1.7221 - 0.577/0.8 \approx 1$$

The p-value is approximately 0.0181 when  $\lambda = 0.8$  and  $\mu = 1$ . The test result is statistically significant ( $\alpha = 0.05$ ), and therefore, the null hypothesis is rejected.

Conclusion: The query and the database sequences are homologous (p-value: 0.0181).
